

1. Develop a multithreaded program where one thread prints numbers from 1 to 10 and another thread prints alphabets from A to J simultaneously.
2. Write a program using two threads where one thread displays even numbers from 1 to 20 and another thread displays odd numbers from 1 to 20.
3. Create a multithreaded application where one thread prints the multiplication table of 5 and another thread prints the multiplication table of 10.
4. Develop a program where one thread counts from 1 to 20 while another thread counts from 20 to 1 simultaneously.
5. Write a program using threads where one thread displays "Good Morning" 10 times and another thread displays "Welcome" 10 times.
6. Create a multithreaded application where one thread generates square numbers from 1 to 10 and another thread generates cube numbers from 1 to 10.
7. Develop a program where one thread simulates file downloading and another thread simulates file uploading using loops.
8. Write a multithreaded program where one thread displays student attendance records and another thread displays student marks records simultaneously.
9. Create a program where one thread prints the first 10 natural numbers and another thread prints the first 10 Fibonacci numbers.
10. Develop a multithreaded application where one thread displays train ticket booking status and another thread displays seat availability updates.
11. Write a program using a daemon thread that continuously logs system activity while another thread performs user operations.
12. Create a multithreaded application where one thread processes ATM withdrawals and another thread generates transaction receipts.
13. Develop a program where one thread displays traffic signal updates and another thread counts vehicles passing through a junction.
14. Write a multithreaded application where one thread plays a song and another thread displays song lyrics simultaneously.
15. Create a program where one thread handles order processing and another thread updates delivery status.
